

Interface Ritual Sketch

Tool: Weight — a calculator where entering a number costs as many presses as its own value

Everyday Tools — Fordham Wong

PART A — RITUAL MAP

PART B — SPEED BUMP V1

PART B — COMPANION V1

PART B — INSTRUMENT PANEL V1

PART C — SIGNATURE INTERACTION

W Signature Interaction — pressing a digit key

Seam shown: the notches are the visible mechanism — they expose exactly how much of the press-count requirement is satisfied, so the key's refusal to register never looks broken. It always looks in progress. No time limit between presses — only the count matters.

REFLECTION

WHICH DIRECTION BEST SUPPORTS AWARENESS + DIGNITY?

Of the three, Speed Bump best protects dignity, because it is the only version that doesn't say anything about the user or their number. Companion's warmth is real, but a character that comments on the size of what you're entering is still commentary on your behavior — it just delivers the judgment gently instead of skipping it, which quietly breaks the Tool Intent's promise not to comment on what a number means. Instrument Panel is neutral, but its single progress meter abstracts the mechanism into a generic gauge, which reads as measurement rather than as the felt friction the tool is built around.

Speed Bump keeps the tally notches as a visible seam: the user can always see exactly why a key hasn't registered yet, with no character interpreting it and no clean number hiding how the interruption actually works. That transparency is what earns trust rather than compliance — the tool never pretends to be smarter or kinder than it is, it just shows its own mechanism plainly, the same way, for everyone, every time.
